NuLegacy Encounters Gold in New Exploration Targets

~ First assays of 2017 Drilling program~

To NuLegacy shareholders/stakeholders:

Hi Folks,   + To view todays' new release

Today's news release provides the first assays from our 2017 exploration drilling campaign (10,500m, 33,500ft, +/- 40 drill holes).

The program is designed to test high priority drill targets in new areas on the company's 38 square mile/98 square km Red Hill property in the Cortez gold trend of Nevada. These geochemical and geophysical targets are at considerable distances from the known mineralization of the Iceberg gold deposit, and have a high risk/high reward profile.

Early results vary from reasonable (Iceberg deposit grade range of 0.9 to 1.1 gram/ton) to modest intervals of anomalous gold. Management continues to be encouraged that every drill hole in every area drilled to date encounters gold mineralization.

Thank you and Cheers,

Albert
